集中配置 1.4.3 说明文档

1 使用说明

1.1 简要配置

暴露接口

- (1) ConfigurationProcess 接口: 包含初始化,配置读、写、删除及添加观察者接口函数。
- (2) Observable 接口: 应用需实现接口,包含一个 callService 回调函数。
- (3) ZKConfigProcess 抽象类:

实现 ConfigurationProcess 接口,另外包含 Zookeeper 建立连接,取得节点数据,删除节点等。

配置文件名

centralized-config.properties

若找不到文件或选项未配置则使用默认值。

文件内容说明

This is the configuring for centralized configuration

#root of data index and env path in zookeeper node structure

#if root configurated but no data index and env, by default, use \$root/data #\$root/index and \$root/env

#if root unconfigurated, by default use /Configuration/default

#u can change default to your project name for avoiding repetition of #configuration name.

#root=/Configuration/default

#data=/Configuration/default/data

#index=/Configuration/default/index

#env=/Configuration/default/env

#if hosts unconfigurated, use 127.0.0.1:2181 to connect to zookeeper server

#hosts=172.168.3.90:2181,172.168.3.90:2182,172.168.3.90:2183

#max index size, if index data size exceed the number(bit),keep the latest #100 rows in index.

#max-index-size=102400

```
#max data size.

#max-data-size=1048576

#default version name

#default_version=default

#path searching for index

#index-home-env-name=INDEX_HOME

#data node name pattern,

#e.g. vds.xml_6687cb15-eb85-4d3d-95b6-5cc208dafc0a_00

#data-node-pattern=:*\...*
```

1.2 写配置

```
ConfigurationProcess cp = new ConfigurationTemplate(); cp.init();// 连接到 zookeeper cp.writeConfig("vds.xml");//默认版本,默认作者 cp.writeConfig("vds.properties", "1.2", "www.tydic.com"); cp.terminate();
```

1.3 读配置

```
ConfigurationProcess cp = new ConfigurationTemplate(); cp.init();
String config1 = cp.getConfig("vds.properties", "1.2");
String config2 = cp.getConfig("vds.xml")
```

1.4 动态监控配置变化

```
//创建集中处理类并初始化
ConfigurationProcess configurationProcess = new GenaralZKConfigProcess();
configurationProcess.init();

Vector<String> checkPoint = new Vector<String>();
checkPoint.add("/vds/sharding/table/partition/accept");
checkPoint.add("/vds/sharding/table/partition/accept2");

// 添加vds.xml的观察者
Observable observer = new ObserverImpl();
configurationProcess.addWatcher("vds.xml", checkPoint, observer);

// 添加 vds.properties的观察者
configurationProcess.addWatcher("vds.properties","1.2","passwd", observer);
```

2 Zookeeper 目录结构

其中

(1) 环境数据为 key=value 形式:

INDEX HOME=/Configuration/default/index

(2) 索引子节点数据包含四列以'\t'分隔,分别代表:

Version author date data1,data2,data3

第四列若多个数据以','分隔。形如:

- 1.2 yuhaiming@tydic.com 2014-09-11 19:32:31.766 vds.xml_762fce84-ab08-4f67-820d-cf07376881b7_00
- $1.4 \quad yuhaiming@tydic.com \\ \quad 2014-09-11 \\ \ 20:26:32.798 \\ \quad vds.xml_2f2d515e-9206-45b3-9af1-0fb0ea0754f8_00 \\ \quad 2014-09-11 \\ \ 20:26:32.798 \\ \quad vds.xml_2f2d515e-9206-45b3-9af1-0fb0ea0754f8_00 \\ \quad 2014-09-11 \\ \ 20:26:32.798 \\ \quad 2014-09-11 \\ \$
- (3) 数据子节点则为具体数据。

```
//Configuration
//Configuration/default
//Configuration/default/data
//Configuration/default/data
//Configuration/default/data/vds.properties_5a91725c-7f95-4ec7-bf28-d87afb294f61_00
//Configuration/default/data/vds.xml_762fce84-ab08-4f67-820d-cf07376881b7_00
//Configuration/default/data/vds.properties_d97da9c8-6f38-48b8-af70-f66447baf19a_00
//Configuration/default/data/vds.xml_2f2d515e-9206-45b3-9af1-0fb0ea0754f8_00
//Configuration/default/index
//Configuration/default/index/vds.xml
//Configuration/default/index/vds.properties
//Configuration/default/env
```

3 代码扩展

3.1 配置位置扩展

配置若位于非 Zookeeper

与 ZKConfigProcess 类似的实现 ConfigurationProcess 接口。

3.2 Zookeeper 中配置数据位置扩展

Zookeeper 中数据段保存的非配置数据而是配置数据的位置信息,如 (1) 位于数据库

{"driver":"oracle.jdbc.driver.OracleDriver","url":"jdbc:oracle:thin:@172.168.1.240:1521:jfdb 1","user":"vds","passwd":"vds","sql":"SELECT a.DRIVER_ID, a.SCHEMA, a.FILTER from INFO DRIVERS ACTIVES a"}

实现 ZKConfigProcessWithDataLocation,有 Zookeeper 取得数据位置后查询数据库获取配置返回。

其 writeConfig 方法写索引到 Zookeeper,写配置信息到数据库。

(2) 位于其他文件系统

如 Hadoop 等
